Hot press molding
Pressing SMC and BMC at elevated temperatures

Application data and cure data
Nouryon is the world’s leading producer of organic peroxides for the curing of thermoset resins, coatings and specialty monomers. We’re home to the best known brands in the thermoset market, examples include Butanox®, Perkadox® and Trigonox®. We also have a whole range of auxiliary products, such as accelerators and promoters, to meet your specific production requirements.

This application guide introduces you to our thermoset product portfolio and helps you to find a suitable curing system for your specific application.

Application
Sheet Molding Compound (SMC) and Bulk Molding Compound (BMC) are intermediate products which are finally pressed to end products in a press at temperatures between 130 and 170°C.

During pressing it is possible to use an in-mold coating to finish the exterior of the product during the curing step.

Nouryon curing agents
The SMC/BMC material is prepared with a combination of peroxides and inhibitors to secure sufficient shelf life during storage and at the same time have high reactivity and efficient curing during pressing leading to low residual styrene levels and, if desired, obtain a high surface quality.

The main peroxides used in SMC/BMC are Trigonox 21S in combination with Trigonox C. Depending on the requirements of the end products alternatives could be Trigonox 21LS, which allows for longer storage stability of the SMC/BMC or Trigonox 141, Trigonox 117 or Trigonox BPI-C75.

For PMC (in-mold Powder Coating) Perkadox BC formulations are used which are reactive at high curing temperatures.

Main products
The pressed end products in concern are very divers and include components for the automotive-, electrical- and building industry.
The process

The process to make SMC is schematically shown above. The process goes from left to right and start with a polymer sheet (PE or PA) on which the resin paste and chopped glass are fed. The resin paste is the formulation of resin containing peroxide, and / or accelerators, inhibitors, promoters, additives, pigments and filler. A top polymer sheet covers the SMC which is pressed and compacted after which it is rolled up. The roll is stored for a period of time to mature the compound and thicken it in in order to make it ready for use. Prior to pressing the required sheet size is cut out, the polymer sheets are removed and the sheet is put in the hot press. In a couple of minutes the sheet is pressed into its final shape.

The BMC process is not shown here but in that case almost the same components are mixed in a high shear mixer. This generates a fluffy flexible bulk mass that can be used in the hot press as well. The advantage here is that the flow of the product is easier and consequently also deep molds can be filled and cured.

Reactivity figures

Some of the reactivity data of the various peroxides are listed below.

Minimum molding time:
Measured in a 4 mm cup shaped molding at 140°C.
1.0 phr Trigonox C  60 sec.
1.0 phr Trigonox BPIC-C75  46 sec.

Residual styrene content:
Measured in a 4 mm cup shaped molding at 140°C after a molding time of the minimum molding time + 30 seconds.
1.0 phr Trigonox C  0.20%
1.0 phr Trigonox BPIC-C75  0.07%

Graph 1. The effect of the peroxide dosage level on the residual styrene content after a molding time of MMT + 30 sec. at 145°C of standard BMC formulations catalyzed with Trigonox C and Trigonox BPIC-C75
Table 1. 
Hot press molding experiments at 150°C with several peroxides and peroxide combinations in a low shrink BMC formulation based on polystyrene

Problems and solutions

Reaching low VOC and low residual styrene levels
Low VOC levels as is required by the automotive industry can be reached with a special cure system, i.e. a combination of Trigonox 21S, Trigonox 117 and Cobalt plus the use of a low shrink or a low profile additive. After pressing the residual styrene levels should be below 0.1%, the benzene level should be below 1 ppm, the smell level should be below 3 and the VOC level should be below 100 ppm. These values all depend on the requirements mentioned in the used methods to determine the specific parameters. Further details on intakes and process settings are available on request.

Traces of benzene
Trigonox C is the most commonly used peroxide for HPM. A disadvantage can be the presence of a small amount of benzene in the end-product after cure. Benzene is a decomposition product of Trigonox C. To assure zero benzene emissions we recommend using a different peroxide like Trigonox 117 or Trigonox 42S. These are aliphatic molecules and do not contain an aromatic ring as part of their molecule.

Reducing the pressing temperature
To reduce the pressing temperature we recommend using a high reactive peroxide like Trigonox 21S. Trigonox 21S however does not have an efficient cure. Efficient curing can be achieved by using efficient peroxides such as Trigonox 117, Trigonox BPIC-C75 or Trigonox C. The optimum process setting for a fast and efficient curing is therefore to use a combination of Trigonox 21S with Trigonox C or Trigonox 117 or Trigonox BPIC-C75. Adding a small amount of cobalt to resin formulations based on peresters (like Trigonox 21S, Trigonox C and Trigonox 42S) will increase the reactivity, but also decrease the shelf-life of the compounds.

Shelf life of the SMC/BMC / influence of pigments or carbon blacks
Perketales like Trigonox 29-C50 or Trigonox 22-C50 are well known to have a very long shelf life (over 6 months at 30°C) in the compound. Also the reactivity and shelf life of the compound is less affected by pigments and carbon black when perketales are used in the formulation.

If you use a fast peroxide like Trigonox 21S then you can improve the shelf life of the SMC/BMC by switching to Trigonox 21LS which contains an inhibitor to improve the shelf life of the compound without affecting the reactivity. Also addition of Inhibitor NLD-20 will give the same effect.

Better gloss
Better gloss can be achieved by using a combination of two peroxides, a fast kicker peroxide with a low activation T (like Trigonox 21S) in combination with a second peroxide which has a high efficiency (a perester like Trigonox C). The combination of the two will assure a fast cure and an improved gloss. The use of a low profile additive will also help to improve the gloss but might lead to increased residual styrene levels.

A summary containing the standard reactivity data of the most used products in this application can be found on the next pages.
Cure data

Trigonox 21S

Trigonox 21S, tert-butyl peroxo 2 ethylhexanoate, is a perester which is used for the curing of unsaturated polyester resin at elevated and high temperatures.

Trigonox 21S is preferred for the curing of UP resin based Hot Press Molding formulation (such as SMC and BMC) in the temperature range of 120 - 160°C. As Trigonox 21S is a high reactive peroxide, it is very suitable as a kicker in formulations for pultrusion and SMC/BMC.

In combination with a cobalt accelerator, Trigonox 21S is also applicable for the cure of UP resins in the temperature range of 60°C and higher. Application area can be air drying lacquers, diplacquers, wall panels, filament winding, etc.

Trigonox 21S has normally a much shorter pot life in the pure resin than Trigonox C, tert-butyl peroxybenzoate

Dosing
Depending on working conditions, the following dosage levels are recommended:

**Trigonox 21S**

1 - 2 phr *

**Accelerator NL-49PN**

0.5 - 3 phr

*(parts per hundred resin)*

**Trigonox C**

Trigonox C, tert-butyl peroxybenzoate, is an aromatic perester, which is used for the curing of unsaturated polyester resins at elevated temperatures.

Trigonox C is preferred for the curing of UP resin based Hot Press Molding formulations (SMC, BMC etc.) in the temperature range of 120-170°C.

Trigonox C can also be used in combination with high reactive peroxides like Perkadox 16 or Trigonox HMa as kicker in formulations for pultrusion in the temperature range of 100-150°C.

In combination with a cobalt accelerator (e.g. Accelerator NL-53N, 10% cobalt), Trigonox C is also applicable for the cure of UP resins in the temperature range of 70°C and higher. Application area can be: air drying lacquers, diplacquers, filament winding, etc.

**Dosing**

Depending on application and working conditions, the following peroxide and when applicable cobalt accelerator dosage levels are recommended:

<table>

Trigonox 21LS

Trigonox 21LS is a perester formulation based on tert-butylperoxy-2-ethylhexanoate, which is used for the curing of unsaturated polyester resin at elevated temperatures.

Trigonox 21LS is preferred for the curing of UP resin based Hot Press Molding formulations (SMC, DMC, BMC, etc) in the temperature range of 120 - 160°C.

As Trigonox 21LS is a high reactive peroxide, it is very suitable as a kicker in formulations for pultrusion and SMC/BMC in combination with peroxides like Trigonox C and Trigonox 29-C50.

Trigonox 21LS gives in comparison with Trigonox 21S a long shelf life stability of the compound, without affecting the cure speed, even when iron oxides or carbon black are used as pigment.

**Dosing**

Depending on working conditions, the following peroxide and when applicable cobalt accelerator dosage levels are recommended:

- **Trigonox 21LS as such**
  - 1 - 2 phr

- **Trigonox 21LS as kicker**
  - 0.5 - 3 phr

Trigonox 141

Trigonox 141, 2,5-Dimethyl-2,5-di(2-ethylhexanoylperoxy)hexane, is a difunctional perester which is used for the curing of unsaturated polyester resins at high temperatures.

Trigonox 141 is preferred for the curing of UP resin based Hot Press Molding formulations (such as DMC and BMC) in the temperature range of 120 - 160°C.

Trigonox 141 is preferably used in combination with a low reactive peroxide like Trigonox C or Trigonox BPIC-C75 and an optimal low profile SMC formulation for the production of HPM parts with a Class A surface at short molding times.

Dosing
Depending on application and working conditions the following peroxide and when applicable cobalt accelerator dosage levels are recommended:

Trigonox 117

Trigonox 117, tert-butylperoxy 2-ethylhexyl carbonate, is an aliphatic peroxide that is used for the curing of unsaturated polyester resins at elevated temperatures.

Trigonox 117 is preferred for the curing of UP resin based Hot Press Molding formulations (SMC, DMC, BMC, etc) in the temperature range of 120 - 170°C.

Trigonox 117 is especially recommended for the production of SMC/ BMC parts, which find their application in the innercompartment of cars.

Trigonox 117 gives a comparable amount of volatile decomposition products during the cure reaction as Trigonox C, tert-butyl peroxybenzoate, however, without benzene.

Trigonox 117 can also be used as ‘finishing’ peroxide in combination with high reactive peroxides like Perkadox 16 or Trigonox HM as ‘kicker’ in formulations for pultrusion in the temperature range of 100-150°C.

Dosing

Depending on application and working conditions the following peroxide and cobalt accelerator dosage levels are recommended:

<table>

Trigonox BPIC-C75

Trigonox BPIC-C75, tert-butylperoxy isopropyl carbonate, is an aliphatic percarbonate, which is used for the curing of unsaturated polyester resins at elevated temperatures.

Trigonox BPIC-C75 is especially developed for the curing of UP resin based Hot Press Molding formulations (SMC, DMC, BMC etc) in the temperature range of 120 - 170°C.

Trigonox BPIC-C75 gives a long shelf life stability of the compound.

Trigonox BPIC-C75 can in comparison with Trigonox C, tert-butyl peroxybenzoate, be characterized as a faster and more efficient peroxide. This means a faster and more optimal cure with a lower residual styrene content of the molded part. In combination with an optimal Low Profile or Low Shrink formulation a very smooth and regular surface of the molded product can be achieved.

The decomposition products of Trigonox BPIC-C75 are low volatile compounds, which makes the peroxide very suitable for the production of e.g. microwave cookware. For a further increase of the reactivity, Trigonox BPIC-C75 can be used in combination with a high reactive peroxide like Trigonox 21 or Trigonox 141.

Dosing

Depending on application and working conditions, the following peroxide dosage level is recommended:

We are a global specialty chemicals leader. Industries worldwide rely on our essential chemistry in the manufacture of everyday products such as paper, plastics, building materials, food, pharmaceuticals, and personal care items. Building on our nearly 400-year history, the dedication of our 10,000 employees, and our shared commitment to business growth, strong financial performance, safety, sustainability, and innovation, we have established a world-class business and built strong partnerships with our customers. We operate in over 80 countries around the world and our portfolio of industry-leading brands includes Eka, Dissolvine, Trigonox, and Berol.
